## Past and present levels of CO<sub>2</sub> in the atmosphere

## Past and present levels of CO<sub>2</sub> in the atmosphere

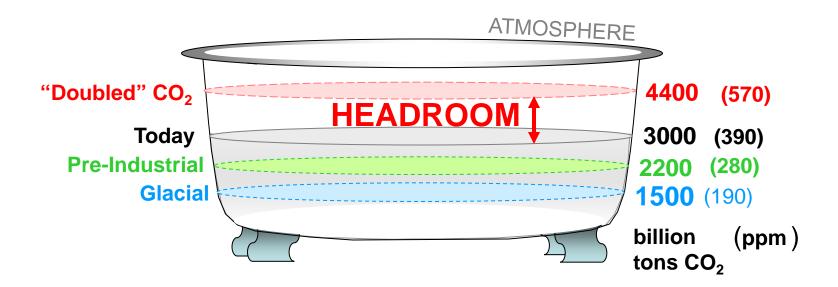

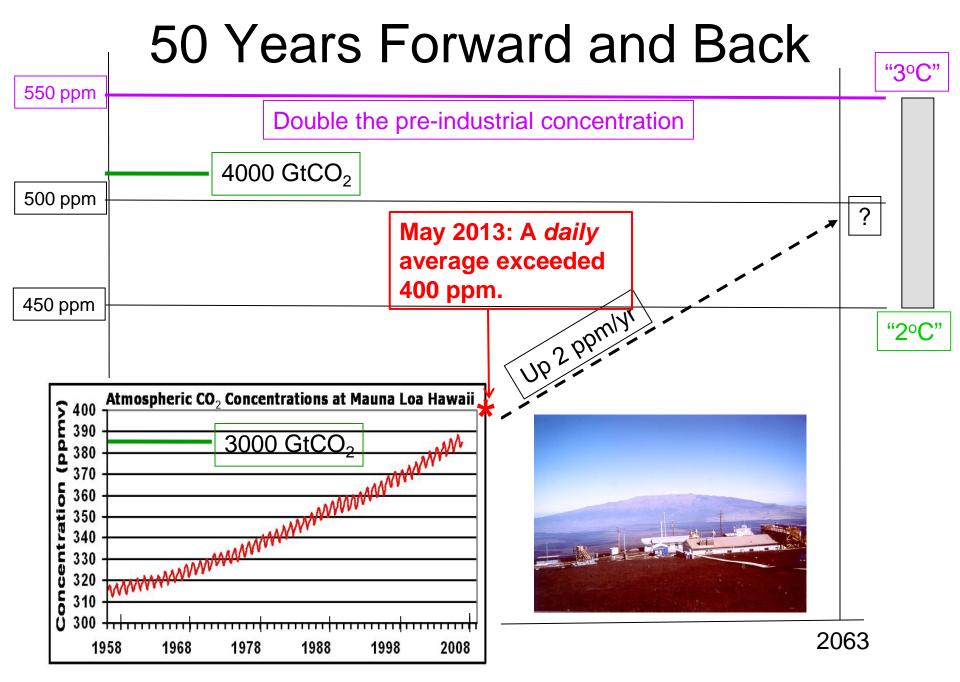

Rosetta Stone: To raise the concentration of CO<sub>2</sub> in the atmosphere by **one part per million**:

add 7.8 billion tons of CO<sub>2</sub>,

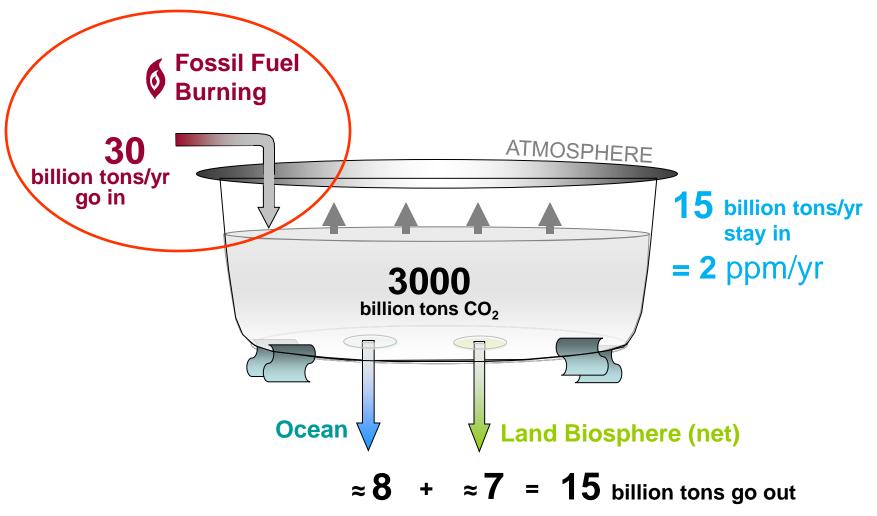

in which are 2.1 billon tons of carbon.

## Past, present, and potential future levels of CO<sub>2</sub> in the atmosphere

### Sources and sinks of CO<sub>2</sub>

Today, global per-capita emissions are ≈ 4 tCO<sub>2</sub>/yr.

## Four ways to emit 4 tonCO<sub>2</sub>/yr (today's global per capita average)

| Activity                                                                        | Amount producing 4 ton CO <sub>2</sub> /yr emissions |  |
|---------------------------------------------------------------------------------|------------------------------------------------------|--|
| a) Drive                                                                        | 24,000 km/yr, 5 liters/100km                         |  |
| b) Fly                                                                          | 24,000 km/yr                                         |  |
| c) Heat home                                                                    | Natural gas, average house, average climate          |  |
| d) Lights  300 kWh/month when all coal-power (600 kWh/month, natural-gas-power) |                                                      |  |

### Princeton University CO<sub>2</sub> in 2007

| University emissions* | 112,000 tCO <sub>2</sub> |
|-----------------------|--------------------------|
| 12,500 participants** |                          |
| Per-capita emissions  | 9 tCO <sub>2</sub>       |

<sup>\*</sup>On-site cogeneration plant, purchased electricity, fuel for University fleet.

What about Politecnico di Milano? Politecnico di Torino?

<sup>\*\*7,100</sup> students and 5,400 employees

# To play Polygame, we adapt The Wedge Model

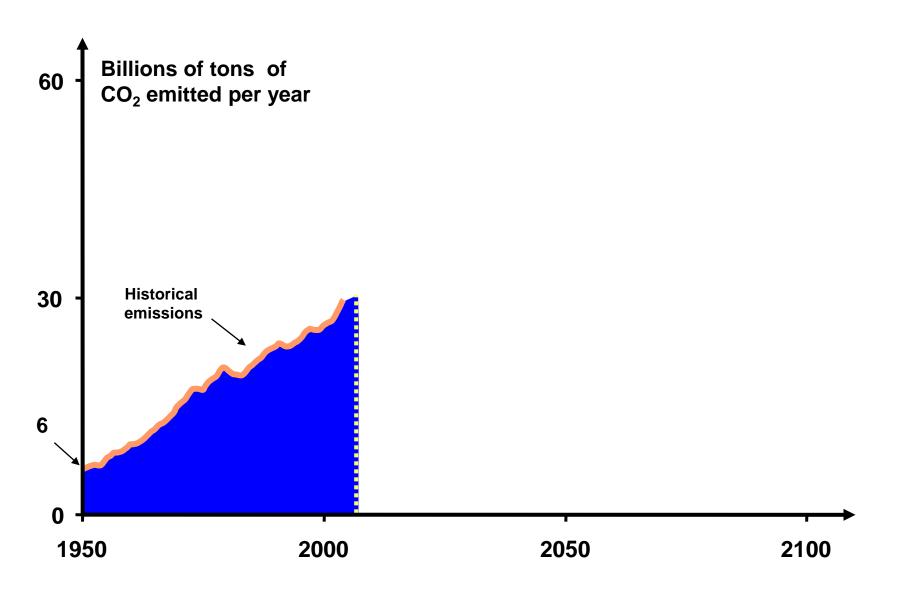

Co-author: Steve Pacala

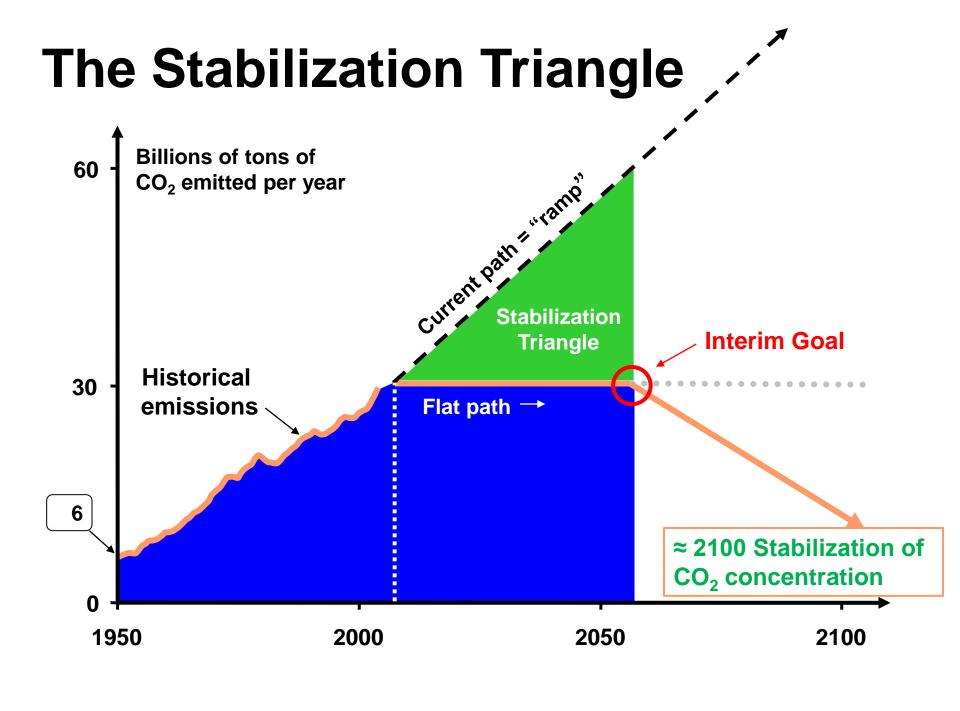

**Articles:** 

**Science** (2004)

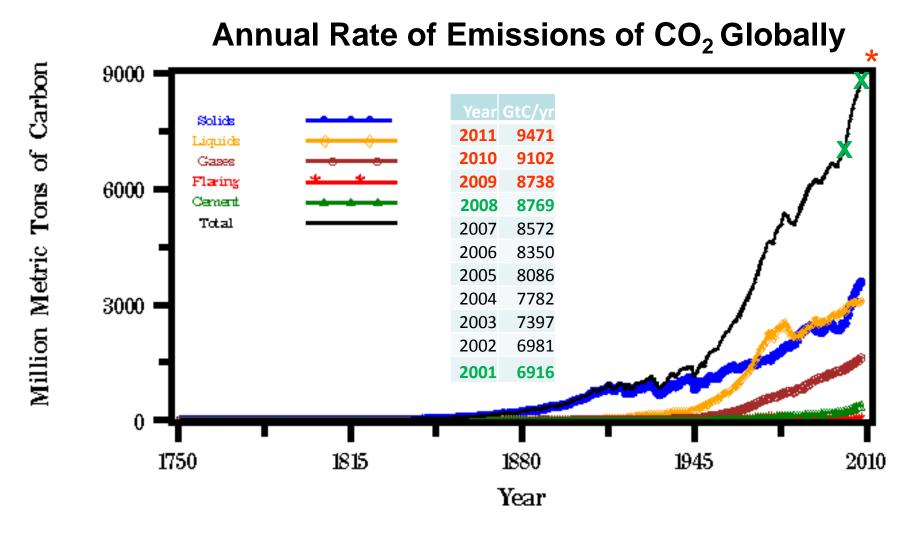

Scientific American (2006)

#### **Historical Emissions**

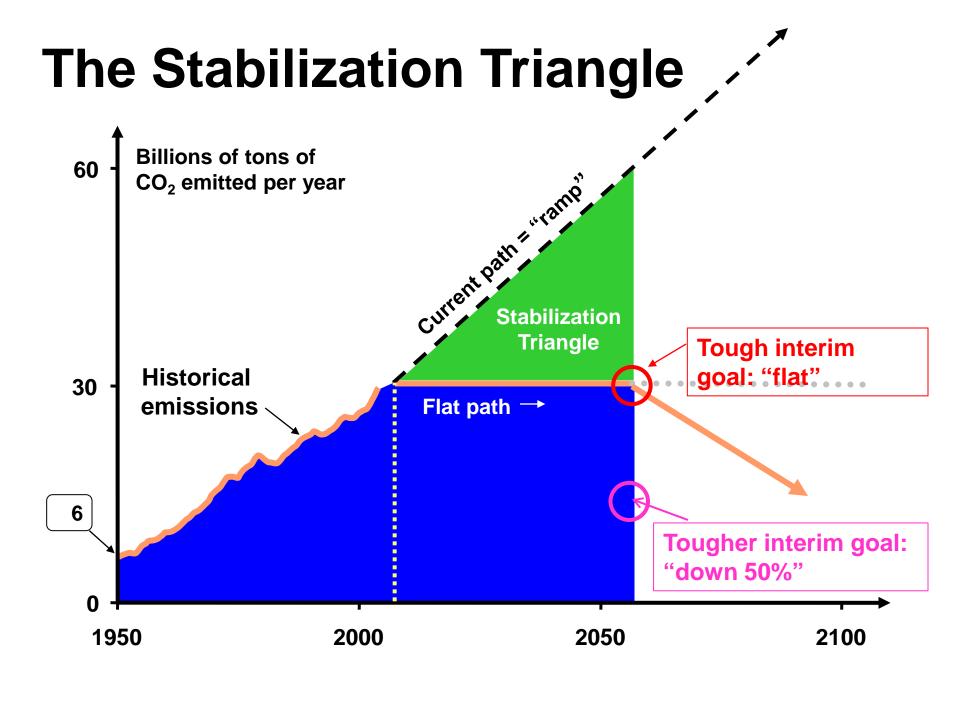

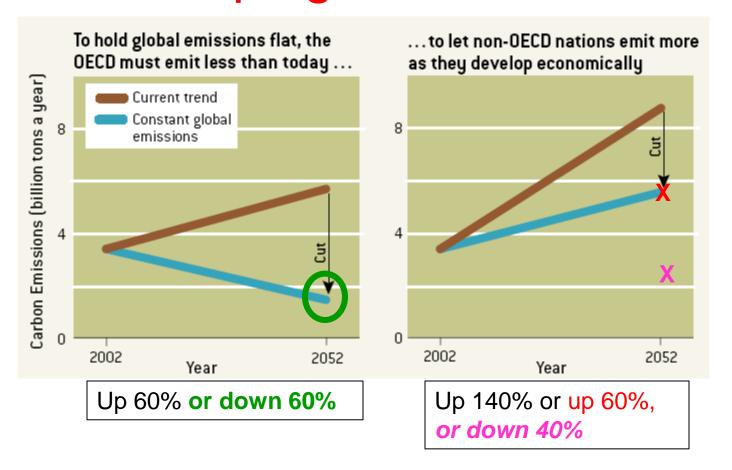

### We have lost precious time.

Source (accessed 10/1/11): <a href="http://cdiac.ornl.gov/trends/emis/glo.html">http://cdiac.ornl.gov/trends/emis/glo.html</a>. Updated 1/5/13

## "Flat" vs. "down 50%" is mostly about the developing world's emissions

Polygame in China must explore low-carbon industrialization.

Source of Figure: Socolow and Pacala, "A plan to keep carbon in check," Scientific American, Sept 2006.

#### GHGs emissions in Italy 1990-2010

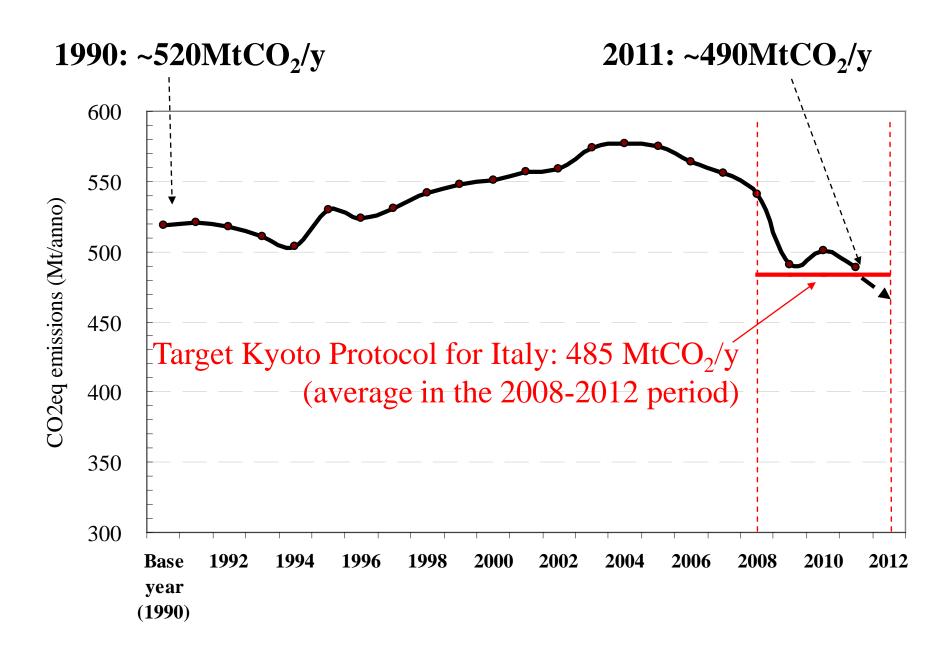

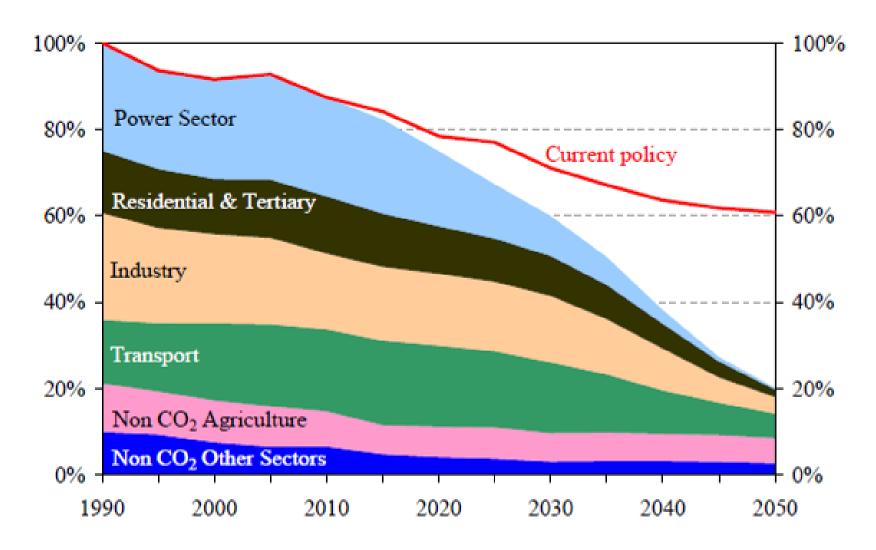

Figure 1: EU GHG emissions towards an 80% domestic reduction (100% =1990)

Fonte: Roadmap for moving to a low-carbon economy in 2050 <a href="http://ec.europa.eu/clima/policies/roadmap/index\_en.htm">http://ec.europa.eu/clima/policies/roadmap/index\_en.htm</a>

#### Four World Views

|                                     |     | Are fossil fuels hard to displace?                        |                                                                          |  |
|-------------------------------------|-----|-----------------------------------------------------------|--------------------------------------------------------------------------|--|
|                                     |     | NO                                                        | YES                                                                      |  |
| Is climate change an urgent matter? | NO  | A nuclear or renewables world unmotivated by climate.     | Most people in the fuel industries and most of the public are here. 5°C. |  |
|                                     | YES | Environmentalists, nuclear advocates are often here. 2°C. | OUR WORKING ASSUMPTIONS. 3°C, tough job.                                 |  |

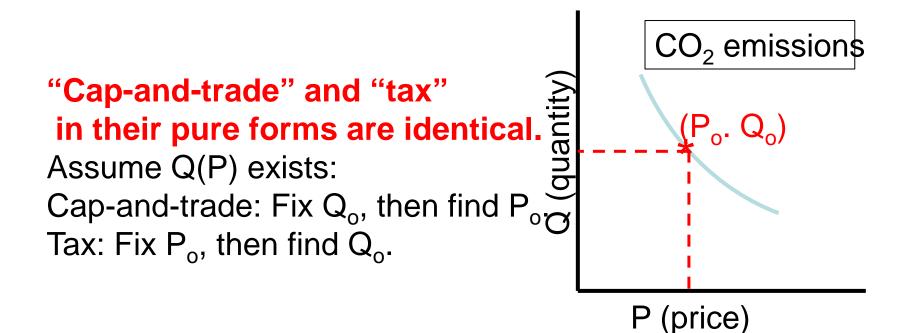

#### How do we bend the curve?

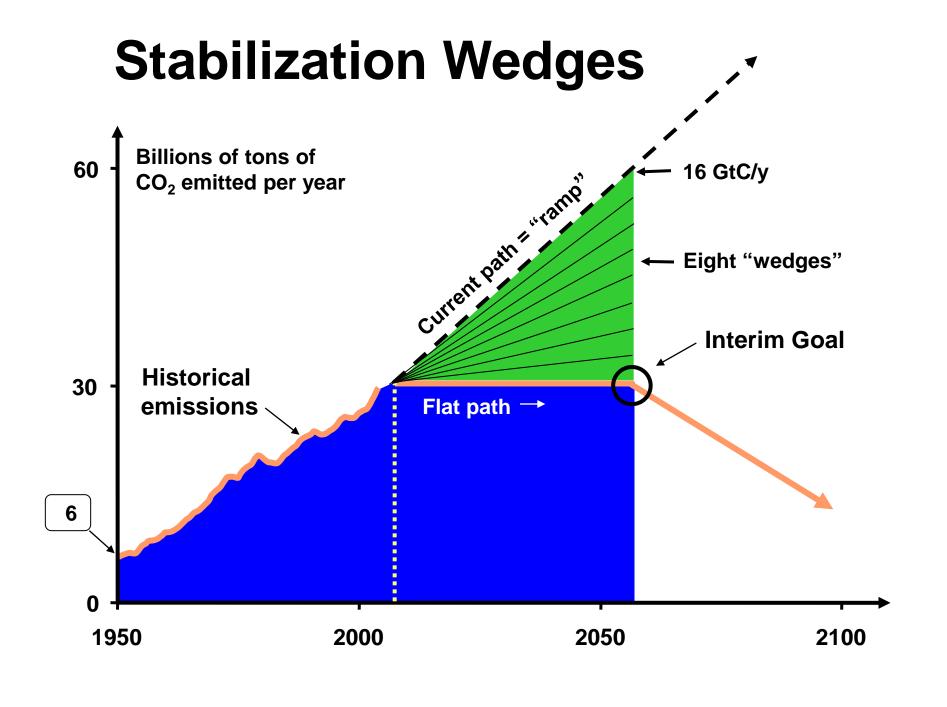

#### Three ways:

Be very smart, so no policy is needed. "S < C" (solar is cheaper than coal).

Regulatory policy and referenda: Forbid and require.

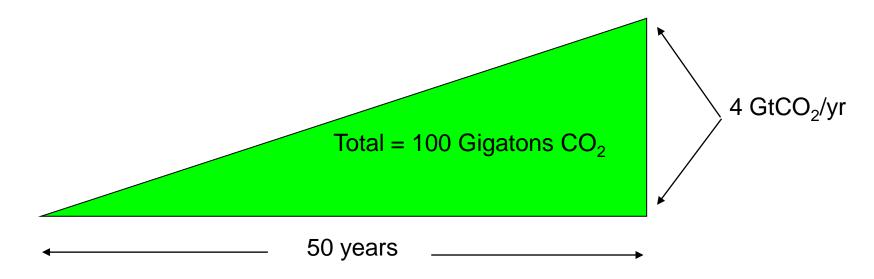

Market-based policies: Change relative prices.

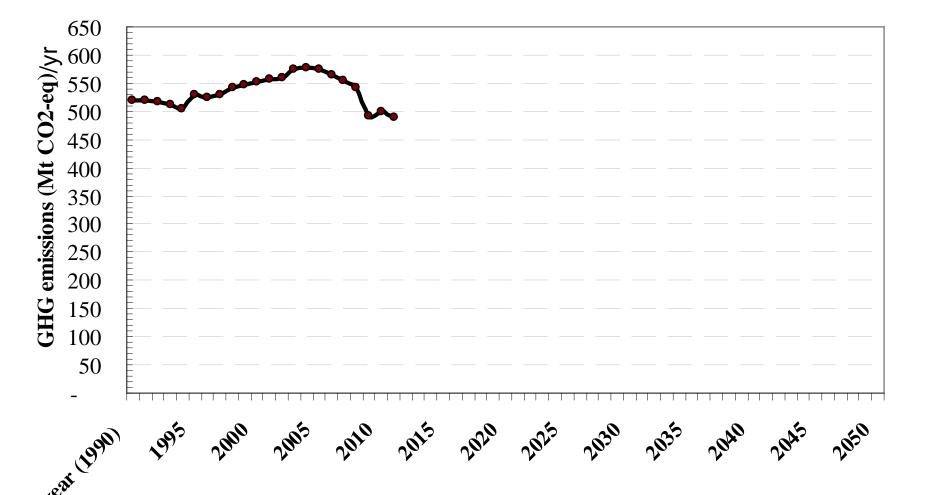

#### What is a Global "Wedge"?

A "wedge" is a strategy to reduce carbon emissions that grows in 50 years from zero to 4 GtCO<sub>2</sub>/yr. The strategy has the potential to be commercialized at very large scale.

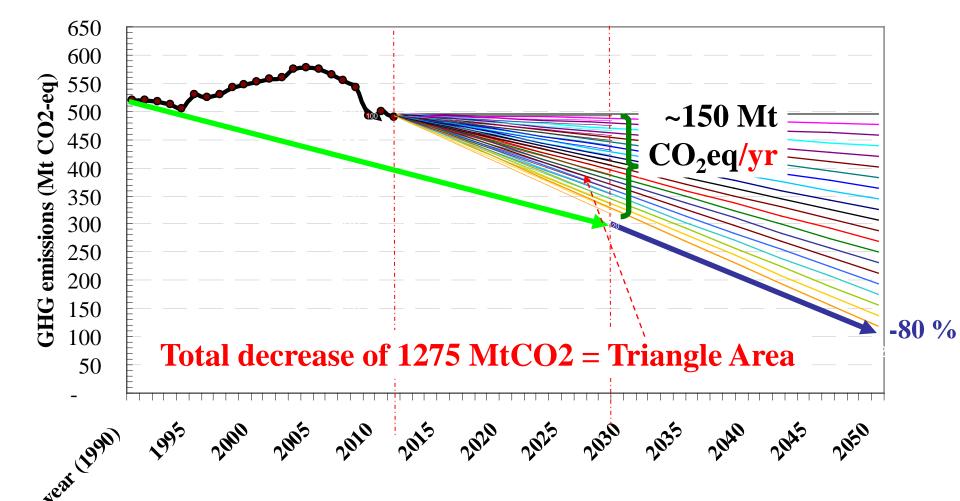

A wedge avoids the emissions of 100 GtCO<sub>2</sub>. This is six trillion dollars at \$60/tCO<sub>2</sub>.

Emission in 2011: 490Mt/y.

We need an additional reduction of 180 Mt/y

We assume that 30Mt/y will be reduced with flexible mechanism (i.e. CDM) and 150Mt/y will be reduced by domestic measures

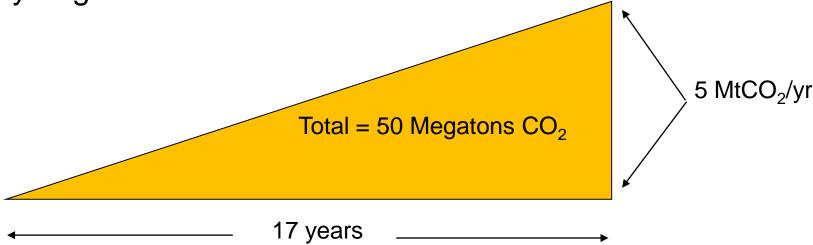

In this game we assume that the reduction of 150 Mt/y CO<sub>2</sub>eq by 2030 is accomplished by combining 30 "strategies" (i.e. wedges) each of which gives a reduction (by the year 2030) of 5 Mt/y.

It is also assumed that the reduction grows linearly, so that the cumulative reduction in the period 2013-2020 is 1275Mt/y

(triangle area=150x17/2)

#### What is a "Polygame Wedge"?

A "polygame wedge" is a strategy to reduce carbon emissions that grows in 17 years from zero to 5 MtCO<sub>2</sub>/yr. The strategy has the potential to be commercialized at very large scale.

A wedge avoids the emissions of 42.5 MtCO<sub>2</sub> (1/2400 of a global wedge). This is 1.7 billion euros at 40€/tCO<sub>2</sub>.

### Needed: 30 wedges

The 30 wedges could be selected between 20 "options" that consider mitigation technologies and practices currently commercially available and in use in Italy

Each single "options" in the PolyGame should have the potential to provide at least one wedge of 5 Mt CO<sub>2</sub>eq at the end of the period (by 2030).

A "solution" can be used for more than one wedge (a total of 30 wedges are needed!)

There could be other options but the 20 selected are the reference for this Polygame

#### Available: 20 wedge strategies (1 of 2)

- 1. Car efficiency
- 2. Ethanol in the fuel
- 3. Reduction of car use
  - 4. Cycling
- 5. Freight moved from truck to rail and ship
  - 6. Energy efficient apartments
    - 7. Efficiency in lighting
  - 8. Efficiency in household electric appliances
  - 9. Efficiency in industrial electric motors

#### Available: 20 wedge strategies (2 of 2)

10. Nuclear energy

11. Efficiency in thermoelectric production

12. Wind turbines

13. Photovoltaic energy

14. Carbon-fuelled power plants with CCS

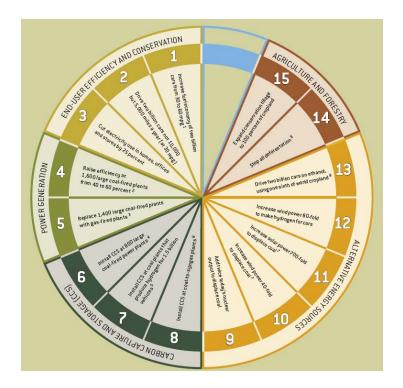

15. Pellets use in domestic appliances

16. Biomass-fueled power plants

#### 17. Forest sinks

- 18. Conservative (e.g. no-tillage) agriculture
- 19. Waste managed in an integrated system
- 20. Reduction of beef consumption in diet

### How many different wedges?

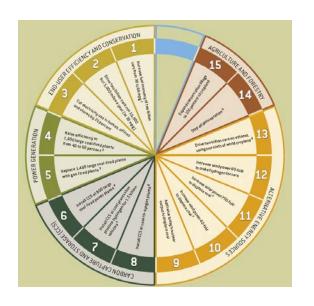

Source; Socolow and Pacala, Scientific American, September 2006, p.54

15 different wedges in Pacala-Socolow

20 different wedges in Polygame, lots of overlap.

You are allowed to create new ones!

### How many different wedges?

Source; Socolow and Pacala, Scientific American, September 2006, p.54

Generic questions about each wedge that you consider.

Is the overall cost to Italy for the second use of a wedge larger or smaller than the cost of its first use? (Is the second "wind" wedge less costly than the first?)

How many times can Italy use the same wedge before creating insurmountable problems?

#### Other wedges?

- 1. Modernise old hydro stations
- 2. Small hydro-electric
- 3. Energy savings
- 4. Electricity from salt water
- 5. Wave power
- 6. Geothermal energy
- 7. Raw muscle power
- 8. Tidal power
- 9. Heat pumps
- 10. Concentrated solar energy
- 11. Electric vehicles
- 12. Fuel cells for shipping
- 13. Cleaner fertiliser production
- 14. Use surplus heat
- 15. Biochar
- 16. Carbon dioxide removal (CDR) from the atmosphere

There are a lot of other things to do: you can try to build a new wedges

### The Polygame assumes that the cost of a climate policy is not the main problem

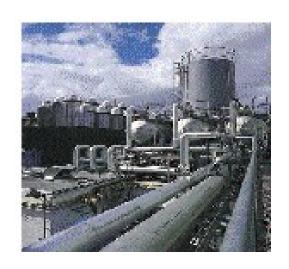

- Some measures are already convenient
- Other measures are likely to be adopted by relying on market force alone
- Others measures are more cost-effective to society when their cobenefits are considered along with their energy and climate benefits
- There are many co-benefits of GHG mitigation: e.g., healthier lives from reduced air pollution, energy security, balance of trade improvement, provision of modern energy services to rural areas, and employment
- Benefits may offset a substantial fraction of mitigation costs
- The costs are not a major barrier

For simplicity, we don't consider in the Polygame the overlap between the reductions of different wedges

### **Demand Wedges**

#### Efficient Use of Electricity

#### Effort needed by 2063 for 1 wedge:

25% reduction in expected 2063 electricity use in commercial and residential buildings

#### Efficient Use of Fuel

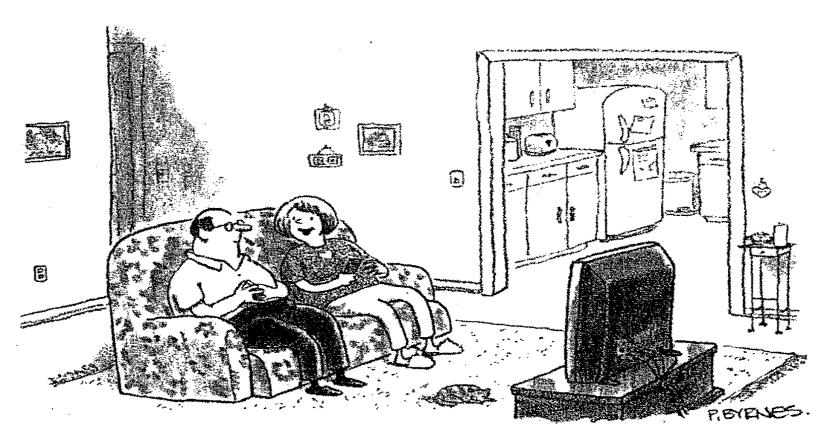

#### Effort needed by 2063 for 1 wedge:

Note: Drive 16,000 km at 8 liters/100km: emit 1 tC (≈ 4 tCO<sub>2</sub>)

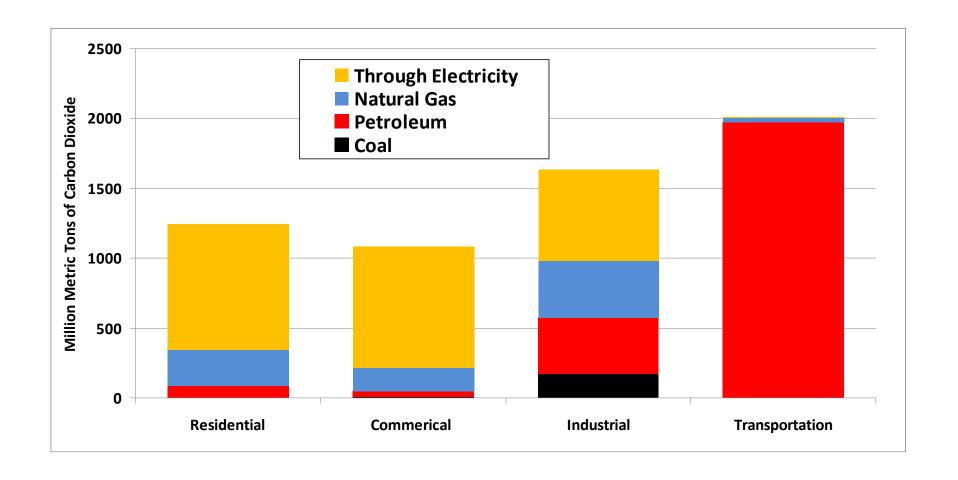

- 2 billion cars driven 16,000 km/yr at not 8 but 4 l/100km.
- 2 billion cars at 8 l/100km, driven not 16,000 but 8,000 km/yr.
- 2 billion cars at 4 l/100km, driven 8,000 km/yr: 1.5 wedges.

### Can virtual experiences substitute for travel?

"When we retire, I want to watch travel videos."

### At the power plant, CO<sub>2</sub> heads for the sky, most electrons head for buildings!

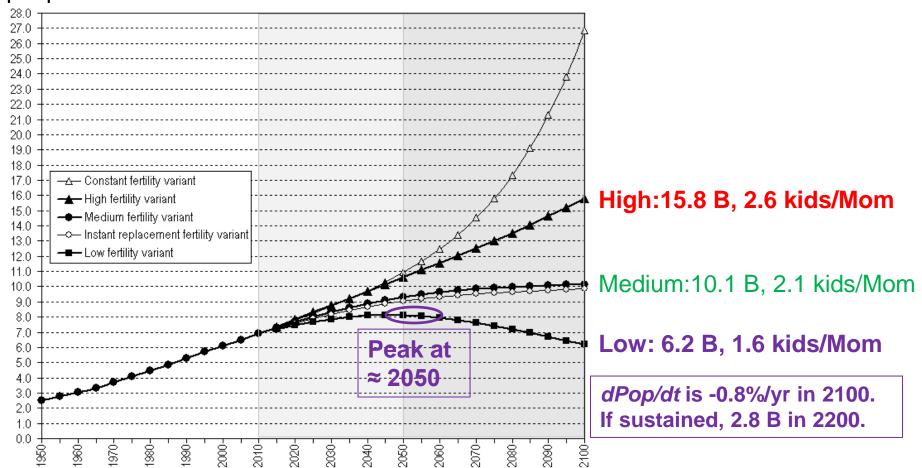

U.S. CO2 emissions, 2007, electricity allocated. Source: J. Sweeney, 2009.

#### The population wedge

Billion people

The UN's "low"population projection has almost 10 billion fewer people in 2100 than its "high" projection.

Source: United Nations. http://esa.un.org/unpd/wpp/unpp/panel\_population.htm

## How many children will you have?

# Climate change is a consequence of prosperity

The CO<sub>2</sub> problem is a problem of modernity, a byproduct of choices about what to consume, how to spend time.

Today, it is nearly universally believed, a good life is one lived with exuberance.

We seek independence, privacy, safety, comfort, beauty, variety of experience – goals that can thwart low-consumption living.

## **Supply Wedges**

#### Coal-electricity Wedges

Assume 700 modern (90% capacity factor, 50% efficient) 1-GW coal plants, with CO<sub>2</sub> vented, will emit 1 GtC each year.

This carbon intensity is:

0.18 kgC/kWh

0.66 kgCO<sub>2</sub>/kWh

Electricity-supply wedges result from not building such plants.

#### Photovoltaic Power

#### Effort needed by 2063 for one wedge:

2000 GW<sub>peak</sub> displacing coal (x3 for intermittency) 2010: 40 GW<sub>peak</sub> (2%),16 GW/yr

If 200 kWh/m<sup>2</sup>-yr and coal at 1 kgCO<sub>2</sub>/kWh, then 2 Mha: 400 million 50-m<sup>2</sup> rooftop units, 200 km x 100 km desert collectors

#### Concentrating Solar Power (CSP)

#### Effort needed by 2063 for one wedge:

2000 GW<sub>peak</sub> displacing coal

2 million hectares, if same land use efficiency as PV

#### Wind Power

# Effort needed by 2063 for 1 wedge:

One million 2-MW<sub>peak</sub> windmills displacing coal power.

2011: 240,000 MW<sub>peak</sub> (12%)

Are they ugly or beautiful?

Source: Hal Harvey, TPG talk, Aspen, CO, July 2007

## Intermittency needs attention

Huge uncharted research frontier. As renewables achieve >20% penetration on grids, intermittency (non-constant, unpredictable) must be addressed.

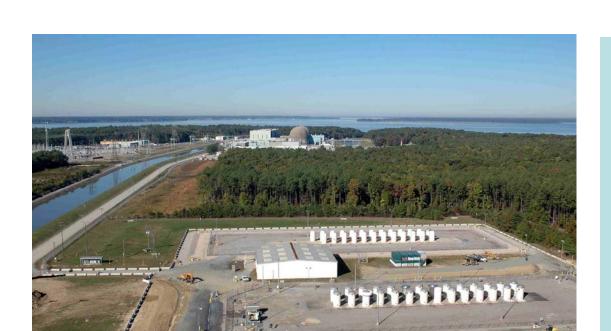

#### Strategies:

Diversity of supply (wind flux is often larger at night)

Complementary energy source (e.g., natural gas)

Storage for various durations, from seconds to days

#### Nuclear Power

# Effort needed by 2063 for 1 wedge:

700 GW (twice current capacity) displacing coal power.

Phase out of nuclear power in favor of coal creates the need for another half wedge.

### Fukushima: How significant?

Source: "After the Deluge: Short and Medium-term Impacts of the Reactor Damage Caused by the Japan Earthquake and Tsunami." Nautilus Institute for Security and Sustainability, March 17, 2011. Figure 4: Fukushima Number 1 Nuclear Power Plant

#### Nuclear power and nuclear war

Before I would welcome a nuclear wedge, I would want to see much stronger international institutions to prevent the diversion into nuclear weapons of the uranium and plutonium associated with nuclear power.

It would be terrible to exchange climate change for nuclear war anywhere on the planet.

#### Fuel Switching: Coal to gas

Photo by J.C. Willett (U.S. Geological Survey).

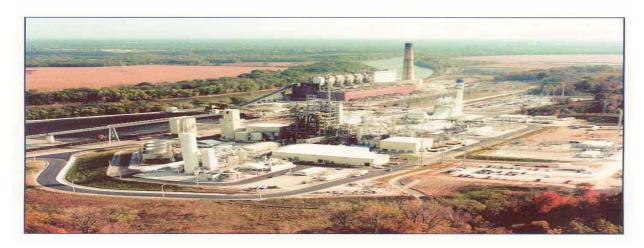

Effort needed by 2063 for one wedge:

Replace the output of 1400 GW of coal-fired electric plants with natural-gas-fired plants.

A wedge requires an amount of natural gas equal to that used for all purposes today.

A wedge requires 50 LNG tanker deliveries every day, or the equivalent of 50 Alaska pipelines

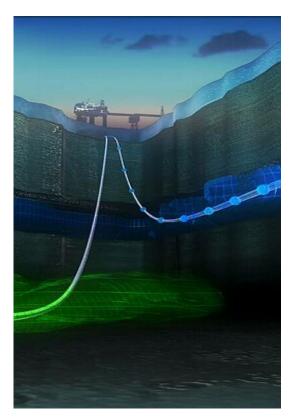

#### Coal with Carbon Capture and Storage

The Wabash coal gasification reprocessing project

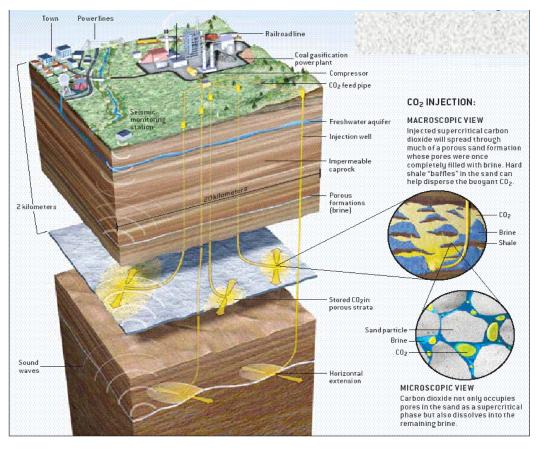

# Effort needed by 2063 for 1 wedge:

Carbon capture and storage at 800 GW coal power plants.

Sleipner field, Norway

## The Future Coal or Natural Gas Power Plant

Shown here: After 10 years of operation of a 1000 MW coal plant, 60 Mt (90 Mm<sup>3</sup>) of CO<sub>2</sub> have been injected, filling a horizontal area of 40 km<sup>2</sup> in each of two formations.

#### Assumptions:

- •10% porosity
- •1/3 of pore space accessed
- •60 m total vertical height for the two formations.

•Note: Plant is still young.

COPYRIGHT 2005 SCIENTIFIC AMERICAN, INC.

SCIENTIFIC AMERICAN 51

www.sciam.com

Injection rate is 150,000 bbl(CO<sub>2</sub>)/day, or 300 million standard cubic feet/day (scfd). That's 3 billion barrels, or 6 trillion standard cubic feet, over 60 years.

"The Wedge Model is the iPod of climate change: You fill it with your favorite things."

David Hawkins, NRDC, 2007.

"The Wedge Model is the iPod of climate change: You fill it with your favorite things."

David Hawkins, NRDC, 2007.

Therefore, prepare to negotiate with others, who have different favorite things.

## **Concluding Thoughts**

# "Solutions" can bring serious problems of their own.

Every "solution" has a dark side.

Conservation Regimentation

Renewables Competing uses of land

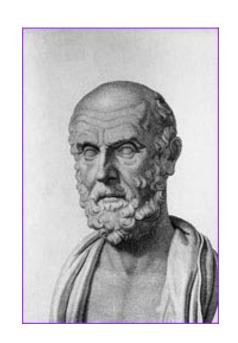

"Clean coal" Mining: worker and land impacts

Geoengineering Technological hegemony

Risk management: In choosing targets, we must take into account both the risks of disruption from climate change and the risks of disruption from mitigation.

## Can a target be too strict?

"I will apply, for the benefit of the sick, all measures that are required, avoiding those twin traps of overtreatment and therapeutic nihilism."

**Hippocrates** 

<sup>\*</sup> Modern version of the Hippocratic oath, Louis Lasagna, 1964. <a href="http://www.pbs.org/wgbh/nova/doctors/oath\_modern.html">http://www.pbs.org/wgbh/nova/doctors/oath\_modern.html</a>

### Grounds for optimism

- 1. The world today has a terribly inefficient energy system.
- 2. Carbon emissions have just begun to be priced.
- 3. Most of the 2063 physical plant is not yet built.
- 4. Many smart and committed young people now find energy problems exciting.

## Fitting on the Earth

Our planet, Earth, is the only one we have.

Fortunately:

Our science has discovered threats fairly early;

We can identify a myriad of helpful technologies;

We have a moral compass that tells us to care not only about those alive today but also about the collective future of our species.

What has seemed too hard becomes what simply must be done.
